

About Metal Roofing

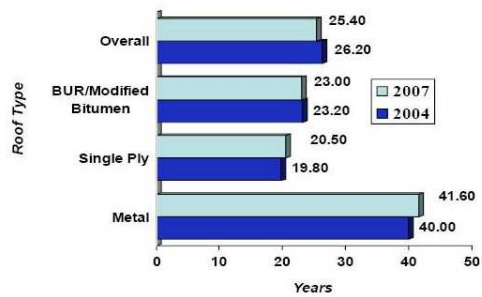

High winds, hail, fire, hurricanes and rain... just a few of the abuses Mother Nature throws at your roof! That is why metal roofing is the fastest growing segment of the entire roofing industry in both the Commercial and Residential segments.

Drexel Metals engineered metal roofs protect your structure from each of these dangers better than any other roofing alternatives available.

There is another reason Metal Roofing is good for Mother Nature... it is one of the greenest and most sustainable materials available. Metal Roofing is primarily manufactured from RECYCLED steel or aluminum. It also REFLECTS the UV that strikes rather than absorbing it into the building and thus reducing energy costs. Additionally Metal Roofing usable life is far longer than any other roofing material.

Expected Roof Service Life By Material

(Defined: Time from original installation through recover/re-roof)

Drexel Metals on-site manufacturing business model dramatically reduces packaging waste as well as transportation and re-transportation of materials... all backed by Drexel Metals quality assurance program and warranties.

Combine all of those advantages with high efficiency Photovoltaic Solar Film, and you can also dramatically reduce your electric costs in both Commercial and Residential applications. It is very exciting to literally watch your meter spin backwards, building yourself more and more credits with the electric utility!
